Functional Activities Questionnaire

Administration

Ask informant to rate patient's ability using the following scoring system:

- Dependent = 3
- Requires assistance = 2
- Has difficulty but does by self = 1
- Normal = 0
- Never did [the activity] but could do now = 0
- Never did and would have difficulty now = 1

Writing checks, paying bills, balancing checkbook	
Assembling tax records, business affairs, or papers	
Shopping alone for clothes, household necessities, or groceries	
Playing a game of skill, working on a hobby	
Heating water, making a cup of coffee, turning off stove after use	
Preparing a balanced meal	
Keeping track of current events	
Paying attention to, understanding, discussing TV, book, magazine	
Remembering appointments, family occasions, holidays, medications	
Traveling out of neighborhood, driving, arranging to take buses	
TOTAL SCORE:	

Evaluation

Sum scores (range 0-30). Cutpoint of 9 (dependent in 3 or more activities) is recommended to indicate impaired function and possible cognitive impairment.

Pfeffer RI et al. Measurement of functional activities in older adults in the community. J Gerontol 1982; 37(3):323-329. Reprinted with permission of The Gerontological Society of America, 1030 15th Street NW, Suite 250, Washington, DC 20005 via Copyright Clearance Center, Inc.

These guidelines/tools are informational only. They are not intended or designed as a substitute for the reasonable exercise of independent clinical judgment by practitioners considering each patient s needs on an individual basis. Guideline recommendations apply to populations of patients. Clinical judgment is necessary to design treatment plans for individual patients. For more information, visit our Web site at www.aviviahealth.com. To contact our Chief Medical Officer, please call 1-888-4AVIVIA (1-888-428-4842).

Interesting characteristics of $F(Y, X)$ in Ingrid's & Alexandra's studies:

- Several high-density regions in the 12D space

- Some features seem more robust if used in a 'discriminative' way: $P(Y \mid X)$, others in a 'generative' way: $P(X \mid Y)$

$$P(Y \mid X_d, X_g) \propto P(X_g \mid Y)\, P(Y \mid X_d)$$

How to quantify the ‘importance’ or ‘prognostic power’ of a set of features?

“Language is a product of, and reflects, thinking.
Sloppy usage reflects sloppy thinking, a kind of thinking
incompatible with good scientific habits of mind”

(D. J. Helfand)

Prediction problem:

guess the six digits of the winning lottery ticket ??????

Clue A: ✔✔✔✔??

Clue B: ✔✔✔?✔?

Clue C: ???✔✔✔

What is the 'importance' or 'predictive power' of each clue?

Scenario 1: we can use **only one** clue

Clue **A**: ✔✔✔✔??

Clue **B**: ✔✔✔?✔?

Clue **C**: ???✔✔✔

Best: **A** or **B** (each gives 1/81 winning chance)

Worst: **C** (gives 1/729 winning chance)

Scenario 2: we can use **all** clues

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

→ We fully know the winning number! 💰

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??

Clue **B**: ✔✔✔?✔?

Clue **C**: ???✔✔✔

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

- Discard **A**: still 100% win ⇒ **A** has 'importance=**0**'

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

- Discard **A**: still 100% win ⇒ **A** has 'importance = **0**'
- Discard **B**: still 100% win ⇒ **B** has 'importance = **0**'

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

- Discard **A**: still 100% win ⇒ **A** has 'importance = **0**'
- Discard **B**: still 100% win ⇒ **B** has 'importance = **0**'
- Discard **A** *and* **B**: 1/9 winning chance

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

- Discard **A**: still 100% win ⇒ **A** has 'importance = **0**'
- Discard **B**: still 100% win ⇒ **B** has 'importance = **0**'

- Discard **A** *and* **B**: 1/9 winning chance

⇒ **A** and **B** together have 'importance > **0**'

Scenario 2: what happens if we **discard** clues?

Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

- Discard **A**: still 100% win ⇒ **A** has 'importance = **0**'
- Discard **B**: still 100% win ⇒ **B** has 'importance = **0**'

- Discard **A** *and* **B**: 1/9 winning chance

⇒ **A** and **B** together have 'importance > **0**'

'0 + 0 ≠ 0'

‘Importance’ or ‘predictive power’ is *not* an *additive* property

Scenario 3: we have to **discard one** clue. Which?

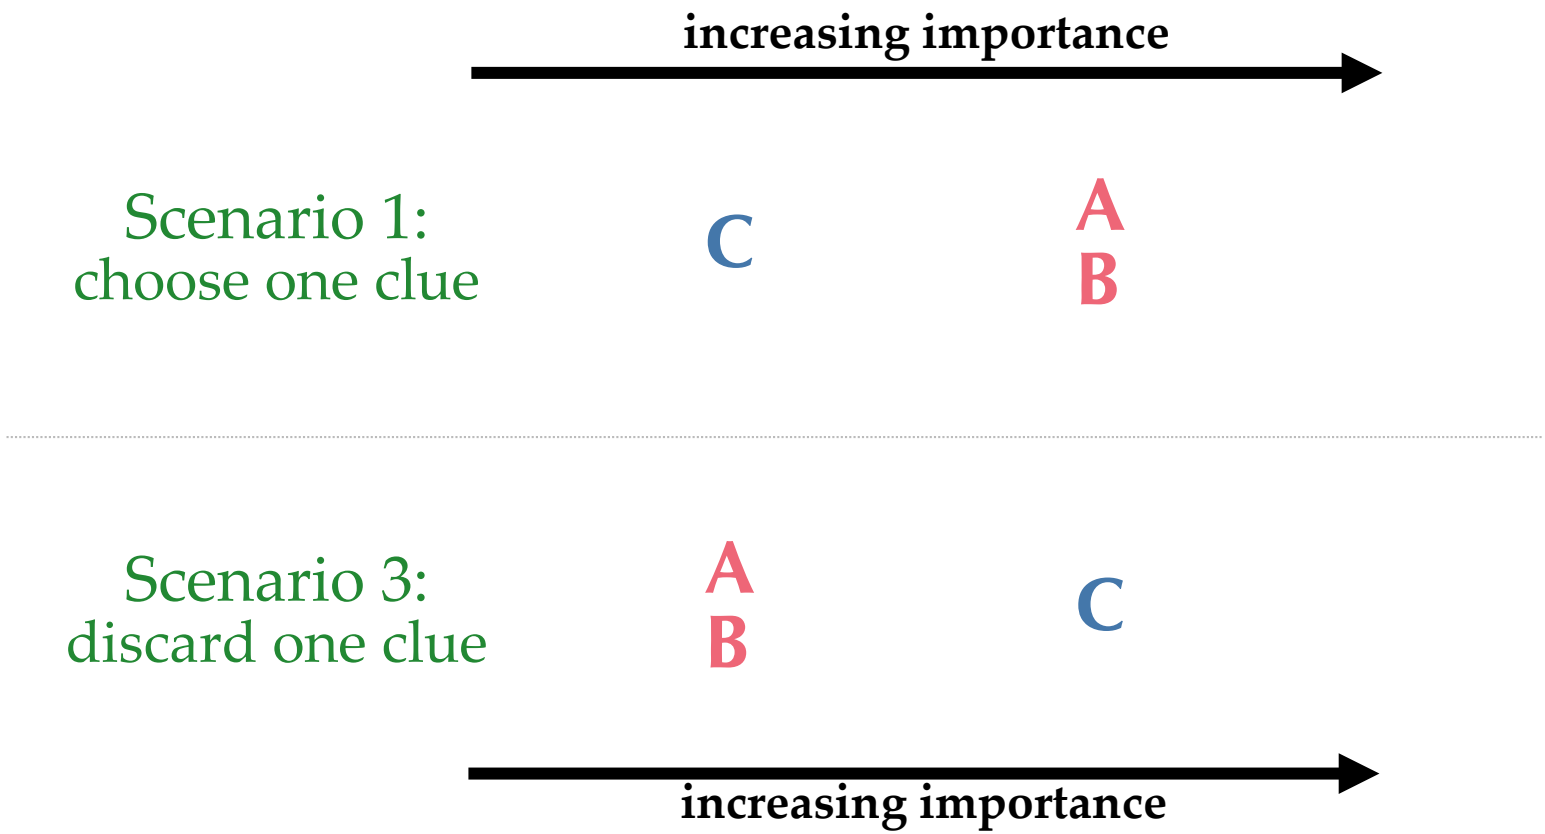
Clue **A**: ✔✔✔✔??
Clue **B**: ✔✔✔?✔?
Clue **C**: ???✔✔✔

discard **A**: still 100% win

discard **B**: still 100% win

discard **C**: 1/9 winning chance

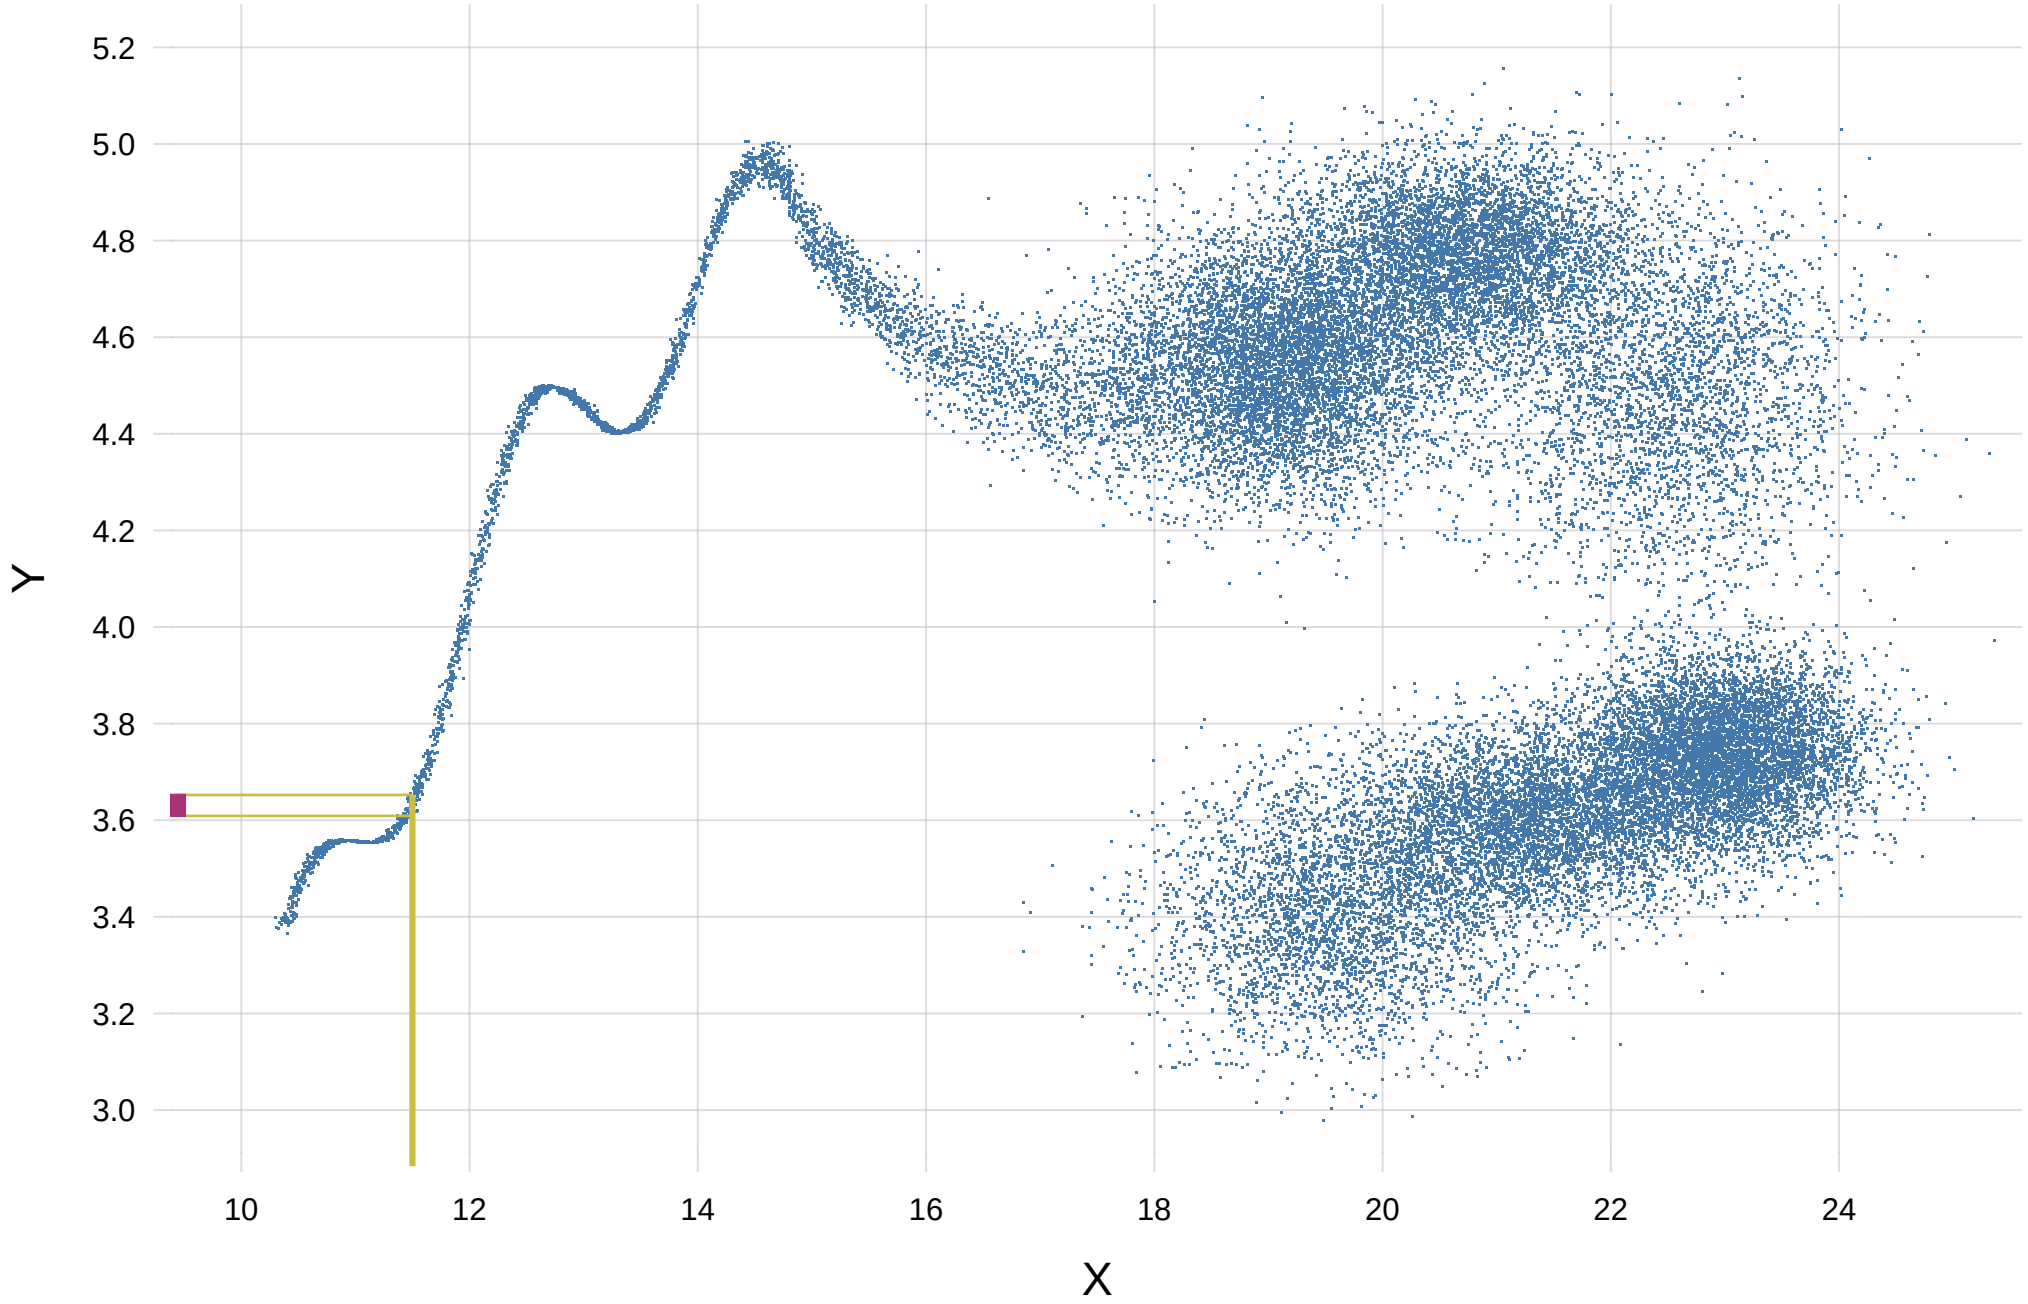
→ If we have to discard one clue, it's most important that we keep **C**

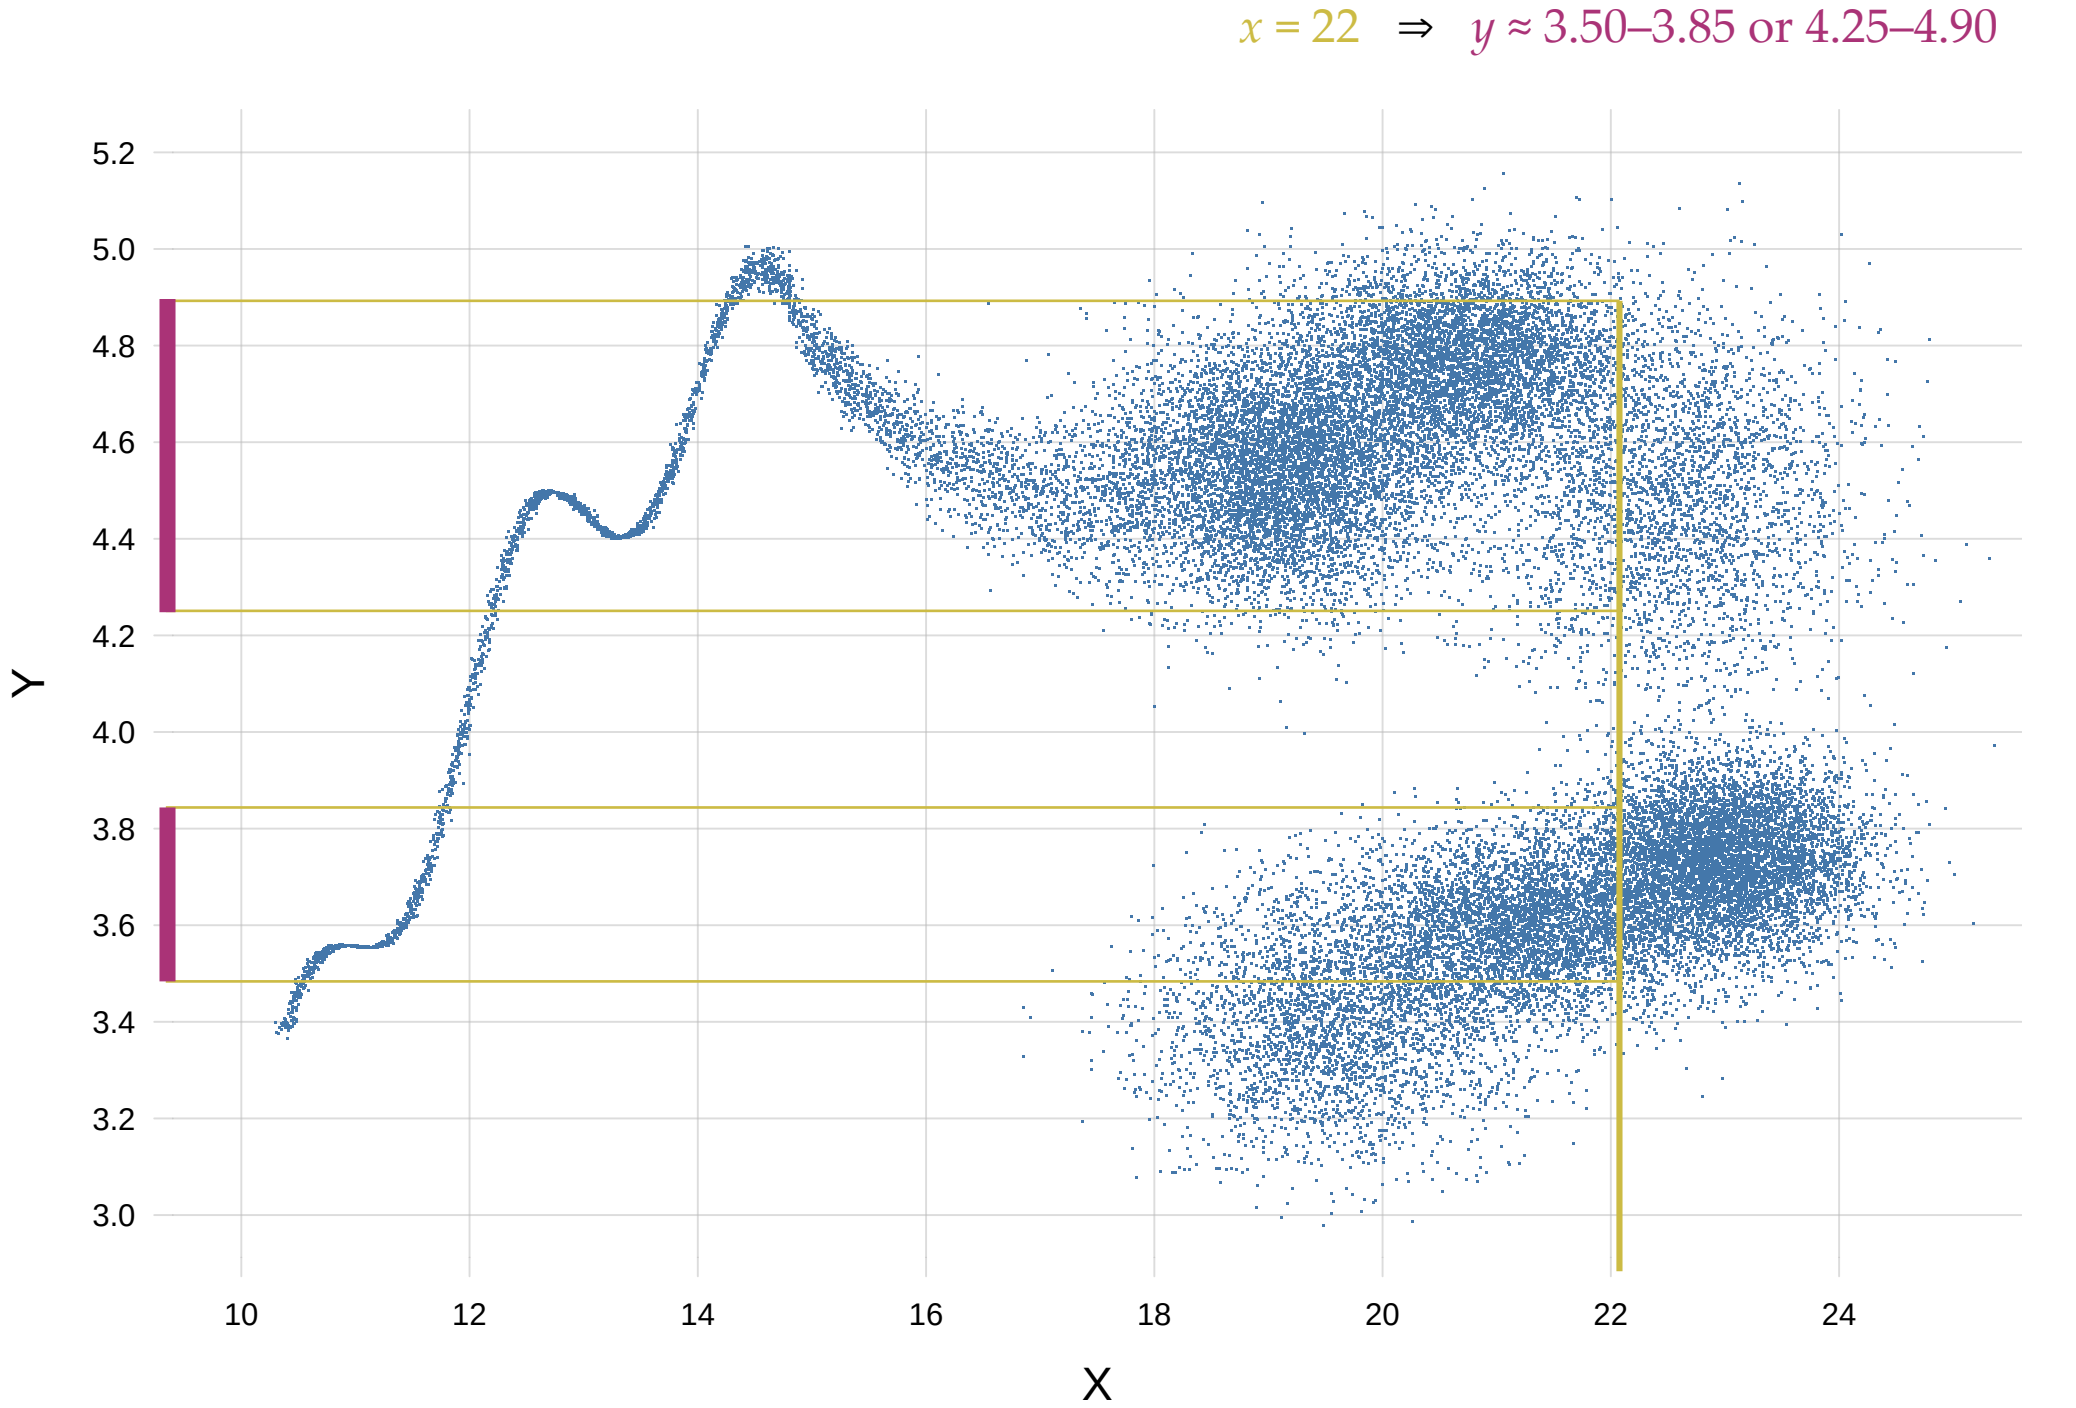


increasing importance
Scenario 1:
choose one clue
C
A
B
Scenario 3:
discard one clue
A
B
C
increasing importance

‘Importance’ or ‘predictive power’ of *X* is *context-dependent*
(which other features are we considering?)

$x = 11.5 \Rightarrow y \approx 3.60–3.65$





$x = 22 \Rightarrow y \approx 3.50–3.85$ or $4.25–4.90$

A Mathematical Theory of Communication

By C. E. SHANNON

Introduction

THE recent development of various methods of modulation such as PCM and PPM which exchange bandwidth for signal-to-noise ratio has intensified the interest in a general theory of communication. A basis for such a theory is contained in the important papers of Nyquist[1] and Hartley[2] on this subject. In the present paper we will extend the theory to include a number of new factors, in particular the effect of noise in the channel, and the savings possible due to the statistical structure of the original message and due to the nature of the final destination of the information.

The fundamental problem of communication is that of reproducing at

Item No.	Name	Symbol	Definition	Conversion factors and remarks
13-24.a	shannon	Sh	value of the quantity when the argument is equal to 2	1 Sh ≈ 0,693 nat ≈ 0,301 Hart
13-24.b	hartley	Hart	value of the quantity when the argument is equal to 10	1 Hart ≈ 3,322 Sh ≈ 2,303 nat
13-24.c	natural unit of information	nat	value of the quantity when the argument is equal to e	1 nat ≈ 1,433 Sh ≈ 0,434 Hart
13-25.a	shannon	Sh		
13-25.b	hartley	Hart		
13-25.c	natural unit of information	nat		
13-30.a	shannon	Sh		
13-30.b	hartley	Hart		
13-30.c	natural unit of information	nat		
13-35.a	shannon	Sh		
13-35.b	hartley	Hart		
13-35.c	natural unit of information	nat		
13-36.a	shannon	Sh		In practice, the unit "shannon per character" is generally used, and sometimes the units "hartley per character" and "natural unit per character".
13-36.b	hartley	Hart		
13-36.c	natural unit of information	nat		

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

X and Y are independent

Using X is no better than flipping a coin

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

$$I(Y;X) = 0.22 \text{ Sh}$$

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

$$I(Y;X) = 0.22 \text{ Sh}$$

In N=100 new prognoses:

- we are **completely certain** about 22
- we are **completely uncertain** about 100−22 = 78

→ approx 22+78/2 = **61** correct prognoses (TP+TN)

If Y is binary:

$$0 \text{ Sh} \leq I(Y;X) \leq 1 \text{ Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

$$I(Y;X) = 0.22 \text{ Sh}$$

In $N=100$ new prognoses:

- we are **completely certain** about 22
- we are **completely uncertain** about $100-22=78$

→ approx $22+78/2 = \mathbf{61}$ correct prognoses (TP+TN)

Any prognostic algorithm which does less than this is performing poorly

If Y is binary:

$$0\ \text{Sh} \le I(Y;X) \le 1\ \text{Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

$$I(Y;X) = 0.22\ \text{Sh}$$

In N=100 new prognoses:

- we are **completely certain** about 22
- we are **completely uncertain** about 100−22 = 78

→ approx 22+78/2 = **61** correct prognoses (TP+TN)

Any prognostic algorithm which does less than this is performing poorly

Upper bound ≈ $\frac{1}{2} + \frac{1}{2}\sqrt{1-(1-0.22)^{\frac{4}{3}}} \approx 77\,\%$ $\pm 0.8\sqrt{N}\,\%$ correct prognoses

If Y is binary:

$$0\ \text{Sh} \le I(Y;X) \le 1\ \text{Sh}$$

X and Y are independent
Using X is no better than flipping a coin

Y is a deterministic function of X
X always yields perfect predictions

$$I(Y;X) = 0.22\ \text{Sh}$$

In $N=100$ new prognoses:

- we are **completely certain** about 22
- we are **completely uncertain** about $100-22=78$

→ approx $22+78/2 = \mathbf{61}$ correct prognoses (TP+TN)

Any prognostic algorithm which does less than this is performing poorly

Upper bound ≈ $\frac{1}{2}+\frac{1}{2}\sqrt{1-(1-0.22)^{\frac{4}{3}}} \approx 77\,\%$ $\pm 0.8\sqrt{N}\,\%$ correct prognoses

Maximum accuracy attainable
by *any* algorithm which uses only feature set X
